Native / kernel-ABI dependency register

`docs/DEPENDENCY_EXCEPTIONS.md` is a register of RustSec **advisory suppressions**. It does not, and was never designed to, gate the addition of a crate. Round 4's independent audit recorded that as finding **F10**. This file is the missing gate, and it is deliberately narrow: it covers only crates that talk to the kernel ABI directly, because those are the ones whose bugs are memory safety or a silently weaker security policy rather than a wrong answer.

Enforced twice: `sandbox::deps` (a unit test, so it fails in the `core` job) and a step in CI's `audit` job.

Crate	Version	Why it is unavoidable	Owner	Reviewed alternative, and why not	Rev dat
`libc`	0.2	Landlock has no stable syscall wrapper in std; `landlock_create_ruleset` / `add_rule` / `restrict_self` (444/445/446) and `prctl(PR_SET_NO_NEW_PRIVS)` are raw syscalls. Already present transitively via `rustix` / `gix-index`.	Tom	The `landlock` crate: rejected, because the ABI-6 `landlock_ruleset_attr` layout and the exact `landlock_create_ruleset(NULL, 0,VERSION)` floor check (C5) are the whole security-relevant surface, and a crate that negotiates "best effort" ABI downgrades is the specific failure C5 forbids.	202
`seccompiler`	0.5	cBPF must be assembled with masked argument comparisons (C2). Hand-written BPF for the same filter is ~200 lines of jump arithmetic with no type checking.	Tom	`libseccomp-sys`: rejected, C-library FFI plus a build-time system dependency, for a filter of ~20 rules. Hand-rolled cBPF: rejected, C2's `Dword` masking is exactly the class of detail hand-rolled jump tables get wrong.	202

Adding a row

1. Confirm the crate genuinely needs kernel ABI access — a crate that merely depends on `libc` does not belong here.
2. Add it to `KERNEL_API_CRATES` in `crates/git-vista-server/src/sandbox/deps.rs`.
3. Add a row here, in the same commit, with a real alternative considered.
