

# Architecture Decision Records

Short, dated records of decisions that shape Git-Vista's architecture — the kind of thing that is expensive to reverse and easy to forget the *why* of. Each ADR captures the context, the decision, the alternatives weighed, and the consequences, so a later reader (or a later us) can see not just what was chosen but what it was chosen over.

One file per decision, numbered in order: `NNNN-short-slug.md`. ADRs are append-only history — supersede an old one with a new one rather than rewriting it, and note the link in both.

| ADR                  | Title                                                                                    | Status                            |
|----------------------|------------------------------------------------------------------------------------------|-----------------------------------|
| <a href="#">0001</a> | Repository identity and the repository-generation algorithm                              | Accepted                          |
| <a href="#">0002</a> | A versioned API contract: protocol negotiation, structured errors, and a transport crate | Accepted                          |
| <a href="#">0003</a> | A server-owned, allowlisted repository catalog addressed by opaque id                    | Accepted                          |
| <a href="#">0004</a> | Protecting loopback sessions and mutating requests                                       | Accepted                          |
| <a href="#">0005</a> | LAN view profile: a read-only second listener                                            | Accepted — implemented            |
| <a href="#">0006</a> | Visualize / Active is chosen per open, every time                                        | Accepted — implementation pending |
| <a href="#">0007</a> | Mode rides the current-repo selection ( <code>POST /api/select</code> )                  | Accepted — implementation pending |
| <a href="#">0008</a> | Persistent, multiple clones under the XDG data dir                                       | Accepted                          |
| <a href="#">0009</a> | Local repos discovered from one configured root, direct children only                    | Accepted — implementation pending |
| <a href="#">0010</a> | Visualizer = existing read-only views plus forge deep links                              | Accepted — implementation pending |
| <a href="#">0011</a> | Gesture slop is pointer-type-aware (touch 12px, mouse/pen 4px)                           | Accepted                          |
| <a href="#">0012</a> | The app shell never scrolls; all scrolling is internal                                   | Accepted                          |
| <a href="#">0013</a> | Protocol v2 for the clone response; <code>set_current</code> returns its own handle      | Accepted                          |
| <a href="#">0014</a> | LAN-view sessions present read-only affordances only                                     | Accepted                          |
| <a href="#">0015</a> | A closed Git-operation vocabulary and the reviewable Plan schema                         | Accepted                          |
| <a href="#">0016</a> | Every write action executes through one shared planner                                   | Accepted                          |
| <a href="#">0017</a> | No arbitrary argv from the browser, held closed by a tripwire                            | Accepted                          |
| <a href="#">0018</a> | Stale, tampered or expired plans never execute                                           | Accepted                          |
| <a href="#">0019</a> | One mutation at a time per shared repository                                             | Accepted                          |
| <a href="#">0020</a> | Idempotent operation lifecycles and reconnectable progress                               | Accepted                          |
| <a href="#">0021</a> | Durable operation journal and recovery references                                        | Accepted                          |
| <a href="#">0022</a> | Paged history, signed cursors, and bounded reads                                         | Accepted                          |

| ADR                  | Title                                                       | Status   |
|----------------------|-------------------------------------------------------------|----------|
| <a href="#">0023</a> | Rehearsal workspaces promote results, atomically            | Proposed |
| <a href="#">0024</a> | Frontend overlay state moves into a Dock-keyed OverlayStack | Accepted |
