

How to launch the Pro (thomas2010) worker session

Everything is already set up. Two steps.

1. Open a new terminal and start Claude Code with the isolated config

```
env CLAUDE_CONFIG_DIR=/home/tom/.claude-pro claude
```

`CLAUDE_CONFIG_DIR` relocates the whole config directory — settings, session history, and credentials. That is what lets a second account stay logged in simultaneously without disturbing this session's login.

The directory `/home/tom/.claude-pro/` already exists and already has the global rules symlinked into it, so the Pro session inherits every standing order (commit identity, PDF conventions, ADR rules, the never-delete-a-branch rule). Without that symlink it would have started with none of them — worth knowing if you ever set up a third.

First launch will prompt for login. Sign in as **thomas2010**. That credential is stored inside `/home/tom/.claude-pro/` and does not touch this session.

2. Paste this prompt

Read `/home/tom/projects/Git-Vista/.claude/parallel/pro-task.md` and do exactly what it says.

You are the Pro worker in a two-account parallel-work experiment. A Max orchestrator session is running concurrently in a different worktree and is actively editing files under `crates/` – the task file lists what you may and may not touch, and that list is a hard boundary, not a suggestion.

Your worktree is `/home/tom/projects/Git-Vista-pro` and you must stay inside it. Do not `cd` into `/home/tom/projects/Git-Vista` to do work; a different session owns that checkout's git index and you would corrupt it.

When you are done, write your results to `/home/tom/projects/Git-Vista/.claude/parallel/pro-result.md` (note: that is in the MAIN checkout, the shared mailbox, not your worktree) and set `worker.status` to "done" in `state.json` in that same directory.

If you become blocked, write the blocker into `pro-result.md` and stop rather than guessing or widening your scope.

What is already done for you

- Worktree `/home/tom/projects/Git-Vista-pro` created on branch `worker/pro/adr-0023-index-repair` at base SHA `635b3df`.

- `/home/tom/.claude-pro/` created with global `CLAUDE.md` symlinked in.
- Repo working agreement `CLAUDE.md` copied into the Pro worktree (it is untracked in this repo, so it does not travel through git on its own — a real gotcha worth remembering).
- Mailbox at `/home/tom/projects/Git-Vista/.claude/parallel/` (gitignored; both sessions use that one absolute path, so no commit/push cycle is needed to exchange messages).

Checking on it from this session

Max polls `pro-result.md` and `state.json` at checkpoints rather than continuously. Nothing needs to be forwarded by hand.
