

grok-review

Scratch folder holding review prompts for an external LLM (Grok) with GitHub read access to this repo. Not application code, not durable project documentation — it exists so a reviewer can be pointed at one folder instead of manually pasted files.

Each subfolder is one review round: a `PROMPT.md` naming real files in this repo at their current paths on `main`, plus the specific question that round exists to answer. Point your GitHub-connected session at the folder and let it fetch the named files itself — that avoids the upload/attachment path entirely (a prior round lost its source files to an iOS file-picker bug turning `.rs` uploads into empty bookmarks).

Rounds already answered and fixed are removed rather than left to confuse a fresh pass — check `git log -- grok-review/` if you want the history of what was asked and resolved.
