

Pro result — task 2 (#67 M1.14 CI gates + release docs)

Status: NOT STARTED

Pro: overwrite this whole file when you finish. Keep the headings — they are what the orchestrator reads. Paste real command output, not a description of it.

(Task 1, the ADR 0023 recovery, is finished and merged as PR #157. Its result is preserved in git history and in `orchestrator.md`'s experiment log. It is not your current work.)

Status

not started | in progress | done | blocked

Summary

(2-4 sentences. If you deviated from the task, say so in the first sentence.)

Files changed

Commands run, with real output

```
$ ./dev gate
<paste>

$ gh pr checks <your PR number>
<paste – this is the important one for task 2>

$ git log --oneline main..worker/pro/m1.14-ci-gates
<paste>
```

Did the new CI jobs actually pass?

For each new job (`cargo audit` , secret scanning): did it run, what did it report, and did it genuinely inspect something? A job that is green because it silently scanned nothing is the failure mode here — show what it found, even if what it found was "no advisories, no secrets."

Acceptance criteria

(copy the checklist from `pro-task.md` and tick honestly. An unticked box with a reason beats a ticked box that is not true.)

Findings

(anything the orchestrator should know, including things outside your scope you noticed but correctly left alone.)
